¹ The balance is the difference between the positive (+) and negative (–) answers. Superlative answers, e.g. "significantly improved" or "got

significantly worse", count double. This means that an extreme value of + or - 200 may be reached. The balance is understood to mean the index. An index value of 0 means an equal number of positive and negative answers. All figures are rounded up.

² With a 95% accuracy rate, the balance represents the overall population, i.e. all households in the given interval (confidence region).
